Gent, 18 April 2007

Outline

- 1 The KRDB group
- 2 Research at KRDB
 - Semantic-based information management
 - Data and information integration
 - Formal bio-ontologies
- 3 LUB Contributions to AROBIO

Members of the KRDB group

Professors:

Diego Calvanese,
Enrico Franconi,
Werner Nutt,
David Toman

Researchers:

Alessandro Artale,
Raffaella Bernardi,
Jos de Bruijn,
Andrea Cali,
Rosella Gennari,
Davide Martinenghi,
Sergio Tessaris

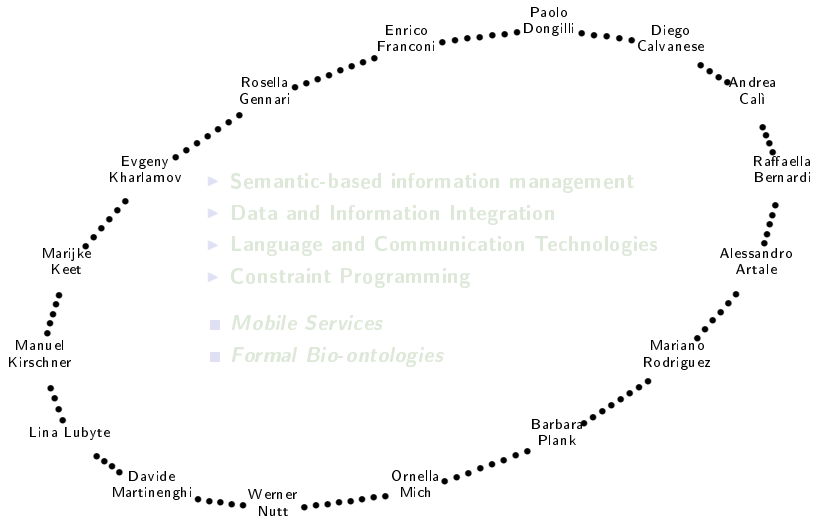

Research Assistants:

Paolo Dongilli,
Daniele Gobbetti,
Barbara Plank

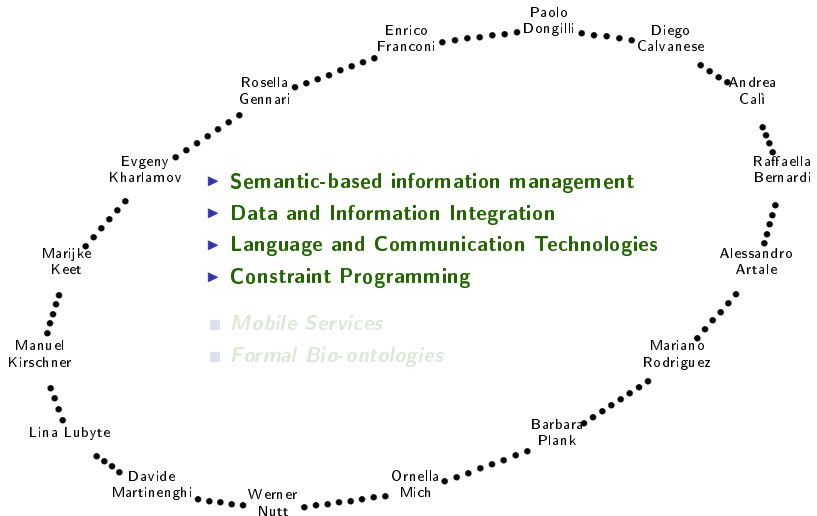

PhD Students:

Marijke Keet,
Evgeny Kharlamov,
Manuel Kirschner,
Lina Lubyte,
Ornella Mich,
Mariano Rodríguez,
Vladislav Ryzhikov,
Camilo Thorne

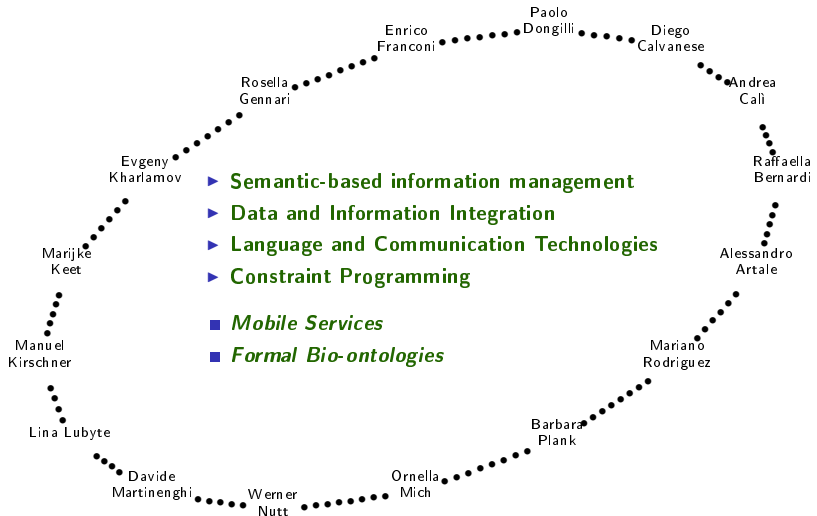

Research topics in the KRDB group

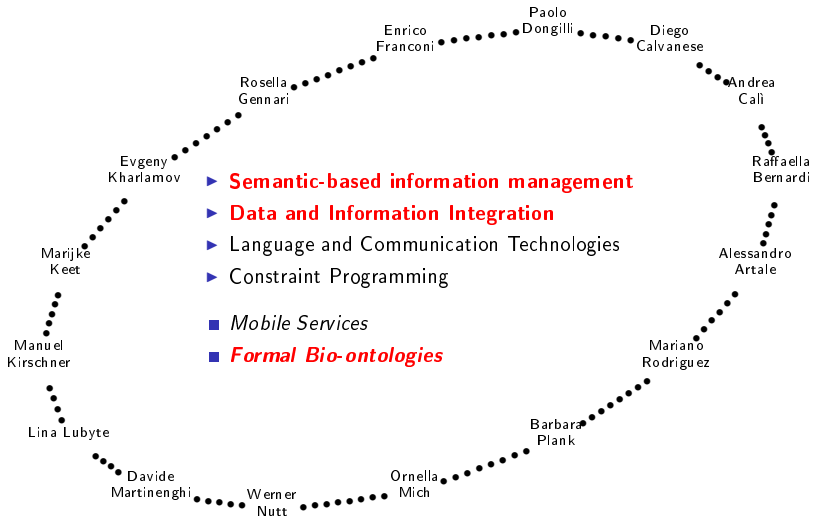

Research topics in the KRDB group

Research Methodology

Research Methodology

Research Methodology

Research topics

- ▶ **Semantic-based information management**
 - ▶ **Data and Information Integration**
 - ▶ Language and Communication Technologies
 - ▶ Constraint Programming
-
- *Mobile Services*
 - ***Formal Bio-ontologies***

Semantic-based information management

Use of semantic-based methodologies and techniques to manage
information explosion and **complexity of data**

Problems and foundational research issues

- ▶ How to pinpoint the right piece of information?
- ▶ How to query and use the available data?
- ▶ How to deal with information sources built *ad-hoc*?
- ▶ How to bridge the gap between information and data? (Semantic Web)

Adopted methodologies and techniques

- ▶ Model information sources at the conceptual level
- ▶ Relationship between conceptual models and logic-based formalisms
- ▶ Automated reasoning techniques to support the whole life-cycle of data management (“intelligent” conceptual modeling tools, ontology-supported query formulation, ontology-based data access)

Semantic-based information management at KRDB

Ontologies: Main activities and research topics

- ▶ Ontology-based data management
- ▶ Languages for ontologies and for the Semantic Web
- ▶ Reasoning over ontologies
- ▶ Ontology design and development (bio-ontologies)

Involved KRDB people: Artale, De Bruijn, Calì, Calvanese, Franconi, Keet, Lubyte, Martinenghi, Ryzhikov, Rodríguez, Tessaris, Toman

Semantic-based information management at KRDB

Developed tools and systems

- ▶ **iCom**: UML based intelligent Conceptual Modelling
 - ▶ graphical user-interface for conceptual modelling
 - ▶ logic-based semantics enables automated support to the modeller
 - ▶ verifies the specification, infers implicit constraints, etc.
- ▶ **QTool**: semantics driven query formulation support
 - ▶ support in formulation of information needs
 - ▶ exploits the schema describing the semantics of the data
- ▶ **QuOnto**: Ontology-based access to data sources (developed in collaboration with the University of Rome)
 - ▶ processes queries over ontologies by relying on relational data
 - ▶ queries ultimately handled by relational engine (scalability)

 - ▶ queries ultimately handled by relational engine (scalability)

Semantic-based information management at KRDB

External partners and projects

- ▶ Work carried within several European projects
 - ▶ **TONES** (Thinking ONtologiES): 3-year Basic Research project coordinated by KRDB — Development of basic inference techniques and tools for ontology management.
<http://www.tonesproject.org/>
 - ▶ **KnowledgeWeb** (Realizing the Semantic Web): 4-year Network of Excellence project — Support the transition process of Ontology technology from Academia to Industry.
<http://knowledgeweb.semanticweb.org/>
 - ▶ **InterOp** (Interoperability Research for Networked Enterprises Applications and Software): 3-year Network of Excellence project –
<http://interop-noe.org/>
- ▶ Industrial partnerships through collaborations within projects
- ▶ KRDB is a member of the W3C (World-Wide-Web Consortium)

Data and information integration

Deals with the problem of providing uniform access to multiple, heterogeneous data and information sources

Problems and foundational research issues

- ▶ How to model an integration system? (global schema, mappings to and from sources, P2P systems, streaming data)
- ▶ How to process queries over integration systems?
- ▶ How to deal with incompleteness of information?
- ▶ How to deal with inconsistencies among sources?
- ▶ How to scale with number and size of information sources

Adopted methodologies and techniques

- ▶ formal tools (based on logic) to model of data integration systems
- ▶ query processing via query rewriting and view-based query answering
- ▶ query processing under constraints (database chase techniques)
- ▶ integration in P2P systems

Data and information integration at KRDB

Developed tools and systems

- ▶ **iCom**:
 - ▶ enables also the modelling and integration of multiple data sources
 - ▶ logic-based mappings to establish semantic relationships
- ▶ **QuOnto**:
 - ▶ handles multiple data sources through mappings from a global schema
- ▶ **coDBz**: peer to peer data management system
 - ▶ Based on a robust logical and computational characterisation of peer-to-peer data management systems
 - ▶ Implements distributed algorithms for robust data sharing and updates

Involved KRDB people: Artale, Calì, Calvanese, Franconi, Kharlamov, Martinenghi, Nutt, Tessaris, Toman

Formal bio-ontologies at KRDB

Foundational research issues: Ontologies in bio-informatics

- ▶ Focus on the conceptual analysis stage (what, why, how), types of relations in ontologies
- ▶ Different languages (expressiveness & limitations of languages)
- ▶ Granularity

Adopted methodologies and techniques

- ▶ Methodology for bottom-up ontology development of ontologies (in ecology mining extant eco-tool)
- ▶ Improving (bio-)ontology management with granularity (e.g., for infectious diseases, granular queries)
- ▶ Foundational relations for biology, such as parthood and transformation
- ▶ Commenced project: *In silico* bio-hypothesis testing using conceptual models

Formal bio-ontologies at KRDB

Foundational research issues: Ontologies in bio-informatics

- ▶ Focus on the conceptual analysis stage (what, why, how), types of relations in ontologies
- ▶ Different languages (expressiveness & limitations of languages)
- ▶ Granularity

Adopted methodologies and techniques

- ▶ Methodology for bottom-up ontology development of ontologies (in ecology mining extant eco-tool)
- ▶ Improving (bio-)ontology management with granularity (e.g., for infectious diseases, granular queries)
- ▶ Foundational relations for biology, such as parthood and transformation
- ▶ Commenced project: *In silico* bio-hypothesis testing using conceptual models

Formal bio-ontologies at KRDB (2)

Involved KRDB people: Artale, Franconi, Keet, Rodríguez

External partners

- ▶ IFOMIS (biomedicine & ontologies)
- ▶ MAD-IBU (bioinformatics, Uni of Amsterdam)
- ▶ LOA-CNR Trento (ontology)
- ▶ Uni Washington (FMA)
- ▶ Ochman lab (molbio & HGT), Evolutionary Genomics Group Uni Tarragona (HGT, bioinformatics)

Organized events

- ▶ CSBio Seminar Series: “Computer Science & IT with/for Biology”
<http://www.inf.unibz.it/krdb/biology/>
- ▶ Hosting co-founder of the OBO Foundry Prof. Barry Smith

Research topics

► WP6

- **Temporal representation & reasoning**: apply & improve latest results on temporal DL language, *DLR_{us}*, and reasoning to adapt it for OWL DL and/or OWL 1.1.
- **Granularity**: develop computationally usable variant of the theory of granularity for use with ontologies/KBs, expand on current types of granular queries to more complex reasoning tasks.
- **Ontolome analysis**: focus on the automated reasoning/querying, feasibility & trade-offs for implementation; comparisons and validating hypothesis against lots of data does not scale well, but should be possible with *DL-Lite*, which also can be used to link the ontology to the data. (latter can be linked to WP5 activities regarding simpler ontology languages)
- **Quantitative aspects**: expand upon modelling & querying role values (and ternary relations)

Research topics

- ▶ **WP2** – Semantic power: collaborate from WP6 to making theory on temporal & quantitative representations usable, ontology development methodology (principles, design criteria), link with top-level ontologies
- ▶ **WP5** – Heterogeneity of data structures: optimisation of mapping between OBO and OWL flavours, including mappings with *DL-Lite*.
- WP3 – visualisation: depends
- WP5 – Persistence of user comments: contribute to requirements engineering modelling (CA phase) for the storage of 'personal' knowledge ?
- WP xx: Any training & dissemination activities ?
